Bibliographies in the Quick Bibliography Series of the National Agricultural Library, are intended primarily for current awareness, and as the title of the series implies, are not indepth exhaustive bibliographies on any given subject. However, the citations are a substantial resource for recent investigations on a given topic. They also serve the purpose of bringing the literature of agriculture to the interested user who, in many cases, could not access it by any other means. The bibliographies are derived from computerized on-line searches of the AGRICOLA data base. Timeliness of topic and evidence of extensive interest are the selection criteria.

The author/searcher determines the purpose, length, and search strategy of the Quick Bibliography. Information regarding these is available upon request from the author/searcher.

Copies of this bibliography may be made or used for distribution without prior approval. The inclusion or omission of a particular publication or citation may not be construed as endorsement or disapproval.

To request a copy of a bibliography in this series, send the title, series number and self-addressed gummed label to:

Extract: Jojoba is a perennial desert shrub native to the Sonora Desert, an area covering parts of Arizona, California, and Mexico. The seeds form jojoba contain an oil that is really a liquid wax, which has properties that make jojoba oil interchangeable with sperm whale oil. Commercial U.S. production is in the infancy stage, but extensive research indicates that a promising market will exist for jojoba in the near future. Successful plant breeding and efficient mechanical harvesting are two major steps that will accelerate commercial production of jojoba.

Abstract: A reference text for food producers, postharvest technologists, and food processors describes postharvest losses of oilseeds. The major and minor oilseed crops of the world are covered. Postharvest oilseed deterioration associated with the botany, physiology, and biochemistry of the individual crop is considedered, with significant differences noted in stoage and postharvest behavior of different oilseed species and cultivars. Following discussions of the food value of oilseeds and seed oils, their postharvest losses, loss reduction technology, and some of the more important characteristics of the biochemistry and aging of oilseeds, attention is focused on separate reviews of the characteristics, postharvest losses, and loss reduction technology of specific oilseeds.~ These separate reviews include: groundnut; sunflower seeds; rapeseed and mustard seeds; safflower seeds; soybean; coconut; oil palm; castor seed; linseed, niger, and cottonseed; crambe, jojoba, olive, and babassu palm; and 18 minor vegetable oils and oilseeds. A detailed discussion of the future pespecties in applications of postharvest technology to oilseeds is appended. Literature references are provided at the end of each of the 15 text chapters.
